

Pod to Pod Communication across nodes

- Basic Workflow

src: pod1
dest: pod4

The **Address Resolution Protocol (ARP)** is a communication protocol used for discovering the link layer address, such as a MAC address, associated with a given internet layer address, typically an IPv4 address. This mapping is a critical function in the Internet protocol suite.

Here, Pod1 want to communicate to Pod4. First package will table within node by container bridge, if no response found it would be forwarded to default route.
